

Primary Market Research Worksheet II: Execution

(Make a new copy of this worksheet for each market segment you analyze)

I.	Which profile are you engaging with: <u>Local Coaching Center Director</u> How well does this person fit the profile: <u>Perfect fit. Runs a 200-student coaching center and currently creates/grades mock tests on paper, although student exams are going to be computer based.</u> Type of engagement (e.g., interview, observation, test, immersion, other): <u>15-minute in-person call and direct observation of their current test-grading and paper-creation workflow.</u>
II.	Your General Script/Framework for Engagement (Guidance: Open-Ended → Qualitative insights/hypotheses → (if appropriate) Quantitative insights/hypotheses and data) (approximately 5 key items): A. (Open-Ended): "Can you tell me about your exact process for creating, distributing, and grading a weekly mock test right now?" (Goal: Identify their biggest time sinks). B. (Qualitative): "How do your students react when they transition from your paper tests to the official digital CBT exams?" (Goal: Validate the 'Simulated Reality Gap' pain point). C. (Qualitative): "What specifically prevents you from using existing digital tools like Moodle or Google Forms?" (Goal: Uncover friction points like IT complexity or missing math symbols). D. (Quantitative): "How many hours per week do you or your staff currently spend manually checking OMR sheets or test papers?" (Goal: Quantify the labor cost). E. (Quantitative): "How much would a platform that completely automates this process and generates digital report cards save you in monthly operating costs?"
III.	What did you learn? <u>Learned that teachers spend over 10 hours a week grading. They are terrified of losing top-performing students to large online EdTechs (like Unacademy/physics wallah), but they find existing LMS tools far too complex to set up without a dedicated IT person.</u>
IV.	What surprised you? <u>Surprised that the biggest friction wasn't the software cost, but the time required to digitize existing paper notes. Typing math equations (LaTeX) and diagrams into digital systems is a massive barrier for non-technical teachers.</u>
V.	Which hypotheses did you seem to confirm? How and why? <u>Confirmed that the "Simulated Reality Gap" is a huge selling point. The tutor explicitly mentioned that some students panic during the actual digital SSC or RRB and other CBT exams after practicing solely on paper.</u>
VI.	Which hypotheses did you seem to invalidate? How and why? <u>Invalidated the idea that teachers want an AI to replace their teaching. They strongly dislike "generic" AI questions. They only want AI to digitize their own proprietary notes to maintain their local brand authority.</u>
VII.	Which hypotheses were you unable to reach conclusions on? Why? <u>Unable to conclude the exact maximum price point they are willing to pay. While they complained about software costs, they couldn't pinpoint a monthly budget since they currently view testing as a "sunk time" cost rather than a direct cash expense.</u>
VIII.	What new questions were raised in this engagement? <u>How can we build a "Zero-Code" PDF-to-test AI parser that requires absolutely no typing or formatting effort from the teacher?</u>

IV.	Additional Future Candidates List Obtained from Current Candidate		
	<u>Name & Contact Info</u>	<u>Profile Type</u>	<u>Why does the current candidate think we should engage with this person, plus any other info to build rapport</u>
	Amit, Alpha Classes	Center faculty	He tested expensive LMS software recently and can share exactly why it failed for his teachers.
	Priya, Biology Tutor for NEET	Center Faculty	She teaches biology but hates grading and taking exam on OMR sheet. Good test case for your zero-code parser.
V.	What changes should I make for the next primary market research engagement?		
	Profile Changes: <u>Focus less on the "owner" and talk with the "typist/DTP operator" or the junior subject teacher who actually does the manual data entry, as they feel the pain most acutely.</u>		
	Qualitative Insights/Hypotheses Updated (could be more or less than 3): A. <u>The "Simulated Reality Gap" is our strongest hook. We must lead with this emotional pain point instead of just "saving time."</u> B. <u>Teachers will reject the software entirely if it requires them to learn LaTeX for math formulas. Our OCR parsing must be flawless.</u> C. <u>Pricing should be pitched as a "cost per student" rather than a flat B2B SaaS fee to align better with their cash-flow models.</u>		
	Quantitative Insights/Hypotheses Updated (Optional – only if appropriate & you are far enough along) (could be more or less than 3): A. <u>Test if saving them >10 hours/week translates to a willingness to pay ₹~5to7/student/month + platform fee/month or year.</u> B. <u>Measure exactly how many PDF mock tests they generate per week (Hypothesis: 1-2 per batch)</u> C. _____		
	Script Update: A. <u>Change opening: I'm researching how non-technical faculty can create question more easily and can save more time.</u> B. <u>Add: If I could show you a way to convert your existing paper test into a CBT link in 60 seconds without typing, would you try it?</u> C. <u>Add: "Can you introduce me to the person who actually types or grades the papers in your center? or if you are not conducting test online then why and what are the challenges are you facing?"</u> D. _____		
VI.	Headline for this Engagement: <u>The great paradox: Teachers are forced to prepare students for digital exams using paper mock tests. They desperately want a CBT simulator, but only if it requires zero technical setup and affordable solution.</u>
